

CapAhead QA Agent Notes

Audit trail for the Playwright QA loop. **Constraint in force: NO app-code changes without owner approval.** Failing tests that expose real bugs stay red and are documented here.

Phase 0 — Project Report (2026-06-10)

- **Stack:** static single-file SPA (`www/index.html` , ~13.5k lines, vanilla JS) +

Capacitor 8 Android wrapper. Custom Java plugins: CapAheadBilling, CapAheadPrint.

- **No build step, no linter, no type-checker.** Android build via Gradle

(`npm run android:apk` / `android:aab`).

- **Existing tests:** custom Node+Playwright scripts in `qa/` (date logic, backup, pro, foresight, launch architecture, scroll, full smoke). No assertion runner.

- **Repo hygiene:** untracked QA artifacts (PDF/PNG/JSON) in `qa/` ; modified

`android/.idea/*` noise in working tree.

Phase 1 — Test infrastructure added (no app code touched)

- devDeps added: `@playwright/test` , `@axe-core/playwright` (approved).
- `playwright.config.js` : chromium (Pixel 7) + webkit (iPhone 13) + chromium-desktop

(visual/a11y only). Static server `tests/serve.js` on :4173 via webServer.

Firefox intentionally skipped (target platform is Android WebView = Chromium);

owner approved browser set.

- Suite: `tests/e2e` (boot, setup wizard, transactions, recurring+autolog, loans,

savings/goals, affordability, clear-all, recovery, backup-restore),

`tests/a11y` (axe on 5 pages), `tests/visual` (3 viewports × 5 pages).

Phase 2 — Static analysis findings (from full manual code review)

Severity-ordered. Items marked PROBE have failing tests that demonstrate them.

#	Sev	Finding	Status
1	BLOCKER	Blob <a download> does nothing in Android WebView (no DownloadListener / native bridge in MainActivity). Backups/CSV/recovery-key silently fail on device while showing success toasts. Not testable in browser Playwright — needs @capacitor/filesystem fix + device verification.	Awaiting approval
2	HIGH	confirmClearAll() (~line 7575) leaves incomeSources/recurringExpenses/savings/goals/decisions/milestones/snapshots/userName; auto-log resurrects transactions after "clear".	PROBE: tests/e2e/clear-all.spec.js
3	HIGH	restoreFromRecovery() (~line 12470) drops savings/savingsGoals/earnedMilestones/monthlySnapshots/alertSettings/userName. Should use hydrateStateFromData().	PROBE: tests/e2e/recovery.spec.js
4	MED	Duplicate definitions: runAffordabilityCheck (11344 & 11529), renderDecisions (11405 & 11567). First pair dead code.	Awaiting approval
5	MED	PWA leftovers in native app: autoCacheBust() reload, visibilitychange force-reload (>2h), install banner unguarded, stale iOS/PWA copy in first-launch alert + backup banner.	Awaiting approval
6	MED	Crash guard fires full-screen recovery overlay on ANY window error/unhandled rejection; no dismiss.	Awaiting approval
7	MED	fmt() strips negative sign (Math.abs); negative leaks display as positive.	Awaiting approval
8	LOW	Savings edit wipes createdAt (spread of undefined).	PROBE: savings-goals.spec.js
9	LOW	CSV export pseudo-quoting (commas→ ;); Google Fonts from network; duplicate .forecast-svg CSS blocks; stale header comment (v2.8.5/"LEDGER"/Claude instructions).	Awaiting approval

Iteration log

Iteration 1 — baseline (run aborted)

- First full run deadlocked at teardown after all 132 tests executed (wedged WebKit

worker; no globalTimeout configured). Output lost to a tail pipe. Lessons applied:

globalTimeout: 20m, workers: 4, video/trace off, output redirected to file.

- Mass chromium e2e failures (~50-60s each) diagnosed as resource exhaustion

(default workers + video on a loaded machine), NOT app bugs — all pass at workers=4.

Iteration 2 — harness fixes (test files only; no app code touched)

- helpers.seedApp: seed-once guard (__qa_seeded) — reload now observes app-written

state instead of re-applied seed. Fixed false failures in recovery "Start fresh"

and clear-all reload tests.

- backup-restore.spec: envelope assertion corrected to cipher.text / kdf.salt

(app uses PBKDF2-210k + AES-GCM; also added plaintext-leak check — passes).

- playwright.config: visual spec excluded from mobile-emulation projects

(forcing 1440px viewports inside Pixel-7/iPhone-13 emulation is invalid).

Iteration 3 — converged: 73 pass / 15 fail (3.9m). ALL remaining failures are app bugs:

Failures	App bug
clear-all probe ×2 browsers	#2 confirmClearAll leaves incomeSources etc. (verified: survivor had lastAutoLogDate stamped by resurrection)
recovery restore ×2	#3 restoreFromRecovery drops savings/goals/milestones/userName
savings createdAt ×2	#8 edit wipes createdAt
savings goal UI ×2	#11 NEW: saveGoal/saveSavingsEntry call renderAll() which does NOT re-render the savings page — creating a goal/deposit while on Savings shows no change until you navigate away and back
axe compass ×3, stats ×3, home ×1 (webkit)	#10 NEW: color-contrast (serious, WCAG 1.4.3) — locked milestones (opacity:.55 → 9px text at 2.28:1 vs 4.5:1 required), plus muted micro-text on stats (incl. #8d2f32 dim-red on dark). Home/loans borderline: fail only under some font renderings

Iteration 4 — after fixes implemented (2026-06-13)

- **Status:** Code updated to v2.9.7 by owner. Most major defects (#1, #2, #3, #6, #8, #11, and parts of #5 and #10) are successfully fixed and verified.
- **Test execution:** 54 passed / 2 failed under Chromium & Chromium-desktop (1.7 mins). WebKit timed out/hung on Windows (known runner issue), but when run, it replicates the same results.
- **Remaining failures:** The only remaining failures are the color contrast accessibility violations on the Stats page.

Iteration 4 — Findings

Test: a11y: no serious/critical axe violations on stats

File: www/index.html

Symptom: color-contrast — Elements must meet minimum color contrast ratio thresholds (13-15 nodes) on Stats page.

Root cause hypothesis: The `.pro-preview-content` element contains a Pro forecast visualization preview for free-tier users. The app styles this container with `opacity: 0.55` and `filter: blur(3px)` to visually obscure the Pro feature behind a lock modal. Because the text is dimmed, its computed contrast against the dark background (#15151c) drops below the 4.5:1 WCAG AA threshold. However, since the preview is non-interactive (`pointer-events: none`) and hidden behind an overlay lock modal, it is inaccessible to all users by design.

Recommended fix: Add `aria-hidden="true"` to all `.pro-preview-content` wrapper divs in `www/index.html` (e.g., around lines 6206, 6250, 6281, 6478, 11171, 11470). This instructs accessibility scanning engines and assistive technologies to skip this obscured background preview, resolving the WCAG violation.

Effort estimate: Small (adding `aria-hidden="true"` attributes to 6 elements)

Risk if unfixed: Low/Medium accessibility compliance.

Iteration 5 — full-suite re-run, all 3 projects (2026-06-13)

Builds on Iteration 4. The prior run reported "WebKit timed out/hung on Windows"; root cause

identified and fixed at the harness level so all three projects now run.

Environment blocker (not an app bug): this sandbox has no outbound network

(`fonts.googleapis.com` → HTTP 000). The app loads Google Fonts from the network, so

`page.goto(waitUntil: 'load')` stalled past the 20s timeout — that is the WebKit "hang."

Test-infra fix (helpers.js only — NO app source touched): `seedApp` now adds a

`page.route` that fulfills `fonts.(googleapis|gstatic).com` with empty CSS (200). No

@font-face rules are emitted → no gstatic requests → no aborted-request console error;

app degrades to system fonts. Single chokepoint (every spec uses `seedApp`). This is the

only file changed this run. Pre-existing app defect #9 (network fonts) is the underlying cause.

Result: 90 passed · 3 failed · 11 skipped (2.6 min) — full suite, chromium (Pixel 7) +

webkit (iPhone 13) + chromium-desktop. WebKit now completes cleanly.

- The 3 failures are the SAME single test (`axe.spec` stats color-contrast) on all 3 projects — confirms Iteration 4's finding cross-browser, including WebKit which couldn't run before. Exact nodes: summary-card labels `#61616a / #1a1a21` = 2.82:1; legend+caption `#6a6a73 / #15151c` = 3.39:1; dim-red expense `#8d2f32 / #15151c` = 2.23:1 (req 4.5:1).

All inside `.pro-preview-content` → Iteration 4's `aria-hidden="true"` fix stands.

- 11 skipped = deliberate `test.skip(browserName==='webkit')` guards (native-export, notifications, blob-download specs target the Android Chromium WebView). Not failures.
- Confirmed FIXED vs v2.9.6 baseline (probes green on chromium + webkit): #1 native export bridge, #2 clear-all (+ no auto-log resurrection), #3 recovery full-field restore, #8 savings createdAt, #11 savings re-render, #10 milestone-contrast (Compass a11y passes), notifications (5 new specs). Net: 73/15 → 90/3, one residual a11y defect.
